No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Description
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 5

Patent No. 587665

GENERAL INFORMATION:
APPLICANT: Sherr, Charles, J.
APPLICANT: Guelle, Dawn, E.
TITLE OF INVENTION: ARF-P19, A No. 5876965el Regulator of the TITLE OF INVENTION: Mammalian Cell Cycle
NUMBER OF SEQUENCES: 12
CORRESPONDENCE ARESS:
ADDRESSEE: Sterne, Kessler, Goldstein & Fox P.L.L.C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ADDRESSEE: Sterne, Kessler, Goldstein & Fox P.L.L.C. Patent No. 5843756
Patent No. 5843756
GENERAL INFORMATION:
SAPPLICANT: Stone, Steven
APPLICANT: Jiang, Ping
APPLICANT: Jiang, Ping
APPLICANT: Mamb, Alexander
TITLE OF INVENTION: MRS GENE AND THERAPEUTIC USE THEREOF
NUMBER OF SEQUENCES: 47
CORRESPONDENCE ADDRESS:
ADDRESSEE: Venable, Baetjer, Howard & Civiletti, LLP
STREET: 1201 New York Avenue, Suite 1000
CITY: Washington
STRATE: DC
COUNTRY: USA
ZIP: 20005
COMPUTER: Eloppy disk
COMPUTER: IBM PC Compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30

Patent No. 591997
GENERAL INFORMATION:
APPLICANT: Beach, David H.
APPLICANT: Beach, David H.
APPLICANT: Bepinho, Ronald A.
TITLE OF INVENTION: Transgenic Animals Having Modified Cell-Cycle
TITLE OF INVENTION: Regulation
NUMBER OF SEQUENCES: 13
CORRESPONDENCE ADDRESS:
                                                                                                         GGTGGTCTTTGTGTACCGCTGGGAACGTCGCCCAGACCGACGGGCATAGCTTCAGCTCAA

//note__vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Plasmid DNA from the normalized library NCI_CGAP_GG4 was prepared, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from a pool of 5,000 clones made from the same library (cloneIDs 1257096-1258631, 1459064-1470983, and 1475592-1476743). Subtraction by Bento Soares and M. Fatima Bonaido. "

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New cell cycle regulating proteins bind to cyclin dependent kinase and related nucleic acids, antibodies etc., used in diagnosis and therapy of abnormal cell proliferation, degeneration etc.

Example 5: Page 81: 109pp; English.

The mouse cell-cycle regulatory (CCR) protein pi3.5 (R85120) was both. by expression of a CDNA clone (T02955) isolated from mouse embryonal stem cells. CCR pi3.5 specifically inhibits the activity of cyclin-dependent kinases during various stages of the cell cycle, and can be used in the treatment and diagnosis of sequence 125 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 7; Fig 19; 80pp; English.
The present sequence represents mouse multiple tumour suppressor 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    - useful for primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 892; DB 1; Length 125;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detecting polymorphism associated with cancer pre:disposition - also DNA, vectors and host cells e.g. for gene or protein replacement therapy and drug screening Example 7: Page 101; 148pp; English. An individual can be diagnosed as having a predisposition to cancer by detecting an alteration in the wild type multiple tumour suppressor (MTS) gene, using gene probes which hybridise to the WTSIELbeta gene ORF 100/14 (which encodes R81700). The above assay can also be used in the diagnosis and prognosis of melanoma, lymphoma, leukaemia and pancreas, breast and thyroid cancers, etc. . Sequence 105 AA:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 7; Column 75-76; 73pp; English.

This is the amino acid sequence of the multiple tumour suppressor (WTSIELS) protein, used in the method of the invention. The WTS gen is useful in the diagnosis and proponsis of human cancer, e.g. by standard nucleic hybridisation techniques, of patient samples. The mutated sequences are those that are present in somatic mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              N-PSDB; V53830.

Nucleic acids based on multiple tumour suppressor, MTS, sequences useful as hybridisation probes, primers and recombinant production of MTS in the diagnosis and treatment of cancers related to MTS mutation(s)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       04-DEC-1998 (first entry)
Amino acid sequence 1 of the multiple tumour suppressor MTSIEIS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents human multiple tumour suppressor IEI-beta (MTSIEI-beta) protein. Primers designed from the gene can be used to design primers to detect abnormalities i.e. polymorphisms which may predispose towards malignancies such as melanoma, leukaemia, astrocytoma, lymphoma, glioma, as well as tumours of e.g. the breast, thyroid, pancreas, uterus and kidneys.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                Gaps
New cell cycle regulating proteins bind to cyclin dependent kinase and related nucleic acids, antibodies etc., used in diagnosis and therapy of abnormal cell proliferation, degeneration etc.

Disclosure; Page 4; 109pp; English.

Cell-cycle regulatory (CCR) proteins (R85116-18, R85120) have the general formula given in R85119. The CCR proteins specifically bind to cyclin-dependent kinases and function as either agonists or antagonists of cell cycle regulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 LT 6

Wild-type multiple tumour suppressor (MTS) gene and mutant sequences

useful in diagnosis, prognosis and therapy of human cancer, e.g.
melanoma or leukaemia

Zeveral multiple tumour suppressor (MTS) polypeptides have been isolated
and sequenced. This sequence is the MTS polypeptides was leading the diagnosis or prognosis of them and mutants of these are useful for the diagnosis or prognosis of human cancer. Germ-line mutations of MTS polypeptide-encoding cDNAs and mutants of these are useful for the diagnosis or prognosis of human cancer. Germ-line mutations of MTS polypeptides and cancers of the pancreas, thyroid, ovary, uterus, testis, kidney, stomach and rectum. The wild-type gene is useful
correct therapy and MTS polypeptides or calls contg. an altered MTS gene are useful for screening for potential cancer
                                                                                                                                                                                                       ö

gene therapy
   of the gene in cancers. The vectors can be used for gene therapy strategies to replace function of mutated protein in patients. These can also be used to construct protein mimetics, also for therapeutic strategies. In addition the expression constructs can also be used for recombinant production of MTS. Recombinant MTS can be used to screen for drugs to be used for cancer therapy, and the protein itself may also be used to restore MTS function in a cell. Sequence 105 AA;

"Wild-type multiple tumour suppressor (MTS) gene and mutant sequences - useful in diagnosis, prognosis and therapy of human cancer, e.g. melanoma or leukaemia

Claim 5: Page 92-93; 156pp; English.

Claim 5: Page 92-93; 156pp; English.

Several multiple tumour suppressor (MTS) polypeptides have been isolated and sequenced. This sequence is the MTS polypeptide MTS!

MTS polypeptide-encoding CDNAs and mutants of these are useful for isolated and sequenced. This sequence is the MTS polypeptide MTS!

MTS cDNAs can be used for diagnosing predisposition to melanoma, it with cancer of the pancreas, thyroid, ovary, uterus, is lymphoma, school and rectum. The wild-type gene is useful cestis, kidney, stomed and rectum. The wild-type gene is useful cor gene therapy and MTS polypeptides may also be used for protein replacement therapy. Also the polypeptides or cells contg. an altered MTS gene are useful for screening for potential cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     44 MMGSARVAELLLLHGAEPNCADPATLTRPVHDAAREGFLDTLVVLHRAGARLDVRDAWG 103

MTSIE1-beta. The MTS gene locus is also referred to as the familial metanoms (MLM) gene locus, located on human chromsome 9p21. Germ line mutations in MTS genes can be used in the diagnosis of predisposition to cancers, e.g. melanoma, leukaemia, astrocytoma, gliboblastoma, lymphoma, glioma, Haddkin's lymphoma, CLL, and cancers of the pancreas, breast, thyrold, ovary, uterus, testis, kidney, stomach and rectum.
                                                                                                                                                                                                                        ö

An individual can be diagnosed as having a predisposition to cancer by detecting an alteration in the wild type multiple tumour suppressor (MTS) gene, using gene probes which hybridise to the MTS1 gene ORF T00736 (which encodes R81701) mutant sequences T00749/50. The above assay can also be used in the diagnosis and prognosis of melanoma, lymphoma, leukaemia and pancreas, breast and thyroid

human cyclin Di. It is genetically linked to the bcl-1 oncogene, a locus activated by translocation to an immunoglobulin gene enhancer in some B-ceal lymphomas and leukaemias. D-type cyclin, cyclin dependant kinase (CDK), PCNA (proliferating cell nuclear antigen) and p21 (a 21 kDa polypeptide) exist in a quaternary complex that many combinatorial variations of the components e.g. cyclin D or D3 and CDK2, CDK4 and CDK5, assemble in vivo. Each quaternary complex may have a subtly diferent role in the cell cycle or in different cell types. Cellular transformation by DNA tumour viruses such as SV40 is associated with selective subunit rearrangement of the cyclin D complexes. In virally transformed cells, CDK4 totally dissociates from cyclin, PCNA and p21 and becomes associated with a 16 kilodalton polypeptide (p16). This sequence, designated p16IRK4, binds to and inhibits CDK4. p16INK4 was discovered to show many similarities to p16. Reagents, such as monoclonal antibodies, can be developed that recognise the interactions between the CDK's cyclins, PCNA and low molecular weight polypeptides and can therefore be used to identify squence 151 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             mutation(s)

This is the amino acid sequence of the multiple tumour suppressor I this is the amino acid sequence of the multiple tumour suppressor I this is the amino acid sequence of the multiple tumour suppressor I this is the amino acid sequence of the method of the invention. The WTS gene is useful in the diagnosis and prognosis of human cancer, e.g. by standard nucleic hybridisation techniques, of patient samples. The mutated sequences are those that are present in somatic mutations of the gene in cancers. The vectors can be used for gene therapy strategies to replace function of mutated protein in patients. These can also be used to construct protein mimetics, also for therapeutic strategies. In addition the expression constructs can also be used to recombinant the round of MTS. Recombinant MTS can be used to screen for drugs to be used for cancer therapy, and the protein itself may also be used to restore MTS function in a cell.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acids based on multiple tumour suppressor, MTS, sequences useful as hybridisation probes, primers and recombinant production of MTS in the diagnosis and treatment of cancers related to MTS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    04-DEC-1998 (first entry)
Amino acid sequence of multiple tumour suppressor 1.
Multiple tumour suppressor 1; MTS-1; human; cancer; hybridisation; somatic mutation; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 151;

Patent No. 5876965
GENERAL INFORMATION
GENERAL INFORMATION
APPLICANT: Sherr, Charles, J.
APPLICANT: Quelle, Dawn, E.
TITLE OF INVENTION: ARR-pl9, A No. 5876965el Regulator of the TITLE OF INVENTION: Marmalian Cell Cycle
NUMBER OF SEQUENCES: 12
CORRESPONDENCE ADDRESS:
ADDRESSEE: Sterne, Ressler, Goldstein & Fox P.L.L.C.
STREET: 1100 New York Avenue Suite 600
CITY: Washington
STATE: D.C.
COUNTRY: USA
ZIP: 20005
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC Compatible
OOPERATION SYSTEM: PC-DOS/MS-DOS
SOFTWARE: PatentIn Release #1.0, Version #1.30
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/954,470
